When you need to hire temporary personnel for your lab, chances are you have two basic requirements.

1. They have to be qualified.
2. They have to be available
when you need them.

Call the one company that specializes
in filling both of those requirements.

CRAIG A. TOWNSEND

Craig A. Townsend is a professor in the Department of Chemistry at the Johns Hopkins University.

Dr. Townsend is an organic chemist, who received the Ph.D. degree under Professor A. Ian Scott at Yale University and completed postdoctoral studies with Professor Duilio Arigoni at E.T.H. Zurich, Switzerland. He has been a faculty member in the Department of Chemistry at the Johns Hopkins University since 1976, and is the current Chemistry Chairman.

Townsend has received several distinguished fellowships and awards including the Alfred P. Sloan Foundation Fellowship and the Stuart Pharmaceuticals Award in Chemistry.

He has made outstanding contributions to research in the biosynthesis of various classes of natural products. His work on β -lactam antibiotics (e.g. clavulanic acid, nocardicin, etc.) and fungal metabolites (the aflatoxins) have won him considerable recognition.

His scientific career includes service on the Editorial Advisory Board of the Journal of Organic Chemistry and as a co-organizer and co-founder of Bioorganic Chemistry Gordon Research Conference. He has presented numerous lectures on biosynthesis of natural products and has over 65 published research papers.

β -LACTAM ANTIBIOTICS: CONVERGENT BIOSYNTHETIC SOLUTIONS TO A COMMON BIOCHEMICAL TARGET

Central to the study of natural products biosynthesis is the recognition that the great diversity of secondary metabolites arises from a quite small number of fundamental pathways. In light of this generalization the biosyntheses of the four major classes of β -lactam antibiotics will be compared. Particular attention will be given to clavaminase synthase, a key oxidative enzyme in the construction of the bicyclic nucleus of the important lactamase inhibitor clavulanic acid. The latter will be examined in some detail using the tools of organic chemistry, enzymology and molecular biology. Its mechanism of action will be compared to analogously iron-dependent enzymes involved in penicillin/cephalosporin formation. The similarities and differences among these proteins and the reactions they catalyze will be discussed in the broader context of the biosynthetic strategies evident in the four principal β -lactam antibiotic pathways.

MARYLAND CHEMIST AWARD

The Maryland Chemist Award was established in 1962 to recognize and to honor, each year, a member of the Maryland Section for outstanding achievement in the field of chemistry. The achievement, as originally stated, may be in pure or applied chemistry, chemical engineering, or chemical education.

Recipients of the Maryland Chemist Award must have been members of the Section for a minimum of five years and have made outstanding contributions to chemistry as defined in Article II of the Constitution of the Society (Chemistry is defined in broad terms). The work on which the award is based should have been performed in Maryland.
